

Regime diagnosis and segmentation logic for localized segmented CSR

Diagnostic labels are used for event filtering and CSR segmentation.

SMDE segmentation used for CSR

Diagnostic loss rate versus storage

Event-level diagnostic rules

Quantity or class	Operational definition
Storage coordinate	$x_s(t) = \{S(t) - S_{end}\} / \{S_{start} - S_{end}\}$
Loss rate	$L_i = -(S_{i+1} - S_i) / \Delta t_i$
Stage-II-like	$R_{trim3}^2 \geq 0.70$ and $r(L, x)_{post3} \geq 0.20$
Stage-I-like	$ r(L, x)_{post3} < 0.20$ and $CV(L)_{post3} < 0.60$
Early transient-heavy	$E_3 \geq 0.40$
Mixed/uncertain	events not meeting the above diagnostic rules

Regime labels are diagnostic proxies for event filtering, not direct flux partitioning.
